Optimization

February 16, 2023

0.1 Optimization for Fully Connected Networks

In this notebook, we will implement different optimization rules for gradient descent. We have provided starter code; however, you will need to copy and paste your code from your implementation of the modular fully connected nets in HW #3 to build upon this.

Utils has a solid API for building these modular frameworks and training them, and we will use this very well implemented framework as opposed to "reinventing the wheel." This includes using the Solver, various utility functions, and the layer structure. This also includes nndl.fc_net, nndl.layers, and nndl.layer_utils.

```
[1]: ## Import and setups
     import time
     import numpy as np
     import matplotlib.pyplot as plt
     from nndl.fc net import *
     from utils.data_utils import get_CIFAR10_data
     from utils.gradient_check import eval_numerical_gradient,_
      →eval_numerical_gradient_array
     from utils.solver import Solver
     %matplotlib inline
     plt.rcParams['figure.figsize'] = (10.0, 8.0) # set default size of plots
     plt.rcParams['image.interpolation'] = 'nearest'
     plt.rcParams['image.cmap'] = 'gray'
     # for auto-reloading external modules
     # see http://stackoverflow.com/questions/1907993/
      \rightarrow autoreload-of-modules-in-ipython
     %load_ext autoreload
     %autoreload 2
     def rel_error(x, y):
         """ returns relative error """
         return np.max(np.abs(x - y) / (np.maximum(1e-8, np.abs(x) + np.abs(y))))
```

```
[2]: # Load the (preprocessed) CIFAR10 data.

data = get_CIFAR10_data()
for k in data.keys():
    print('{}: {} '.format(k, data[k].shape))

X_train: (49000, 3, 32, 32)
y_train: (49000,)
X_val: (1000, 3, 32, 32)
y_val: (1000,)
X_test: (1000, 3, 32, 32)
y_test: (1000,)
```

0.2 Building upon your HW #3 implementation

Copy and paste the following functions from your HW #3 implementation of a modular FC net:

- affine_forward in nndl/layers.py
- affine_backward in nndl/layers.py
- relu_forward in nndl/layers.py
- relu_backward in nndl/layers.py
- affine_relu_forward in nndl/layer_utils.py
- affine_relu_backward in nndl/layer_utils.py
- The FullyConnectedNet class in nndl/fc_net.py

0.2.1 Test all functions you copy and pasted

```
[3]: from nndl.layer_tests import *

affine_forward_test(); print('\n')
affine_backward_test(); print('\n')
relu_forward_test(); print('\n')
relu_backward_test(); print('\n')
affine_relu_test(); print('\n')
fc_net_test()

If affine_forward function is working, difference should be less than 1e-9:
difference: 9.769848888397517e-10

If affine_backward is working, error should be less than 1e-9:
dx error: 3.1350052789632175e-10
dw error: 3.304426457498361e-10
db error: 5.904796441023863e-12

If relu_forward function is working, difference should be around 1e-8:
difference: 4.999999788022158e-08
```

```
If relu_forward function is working, error should be less than 1e-9:
dx error: 3.2756200311074745e-12
If affine_relu_forward and affine_relu_backward are working, error should be
less than 1e-9::
dx error: 1.311080410589162e-10
dw error: 2.468488919627008e-10
db error: 2.367137183126194e-11
Running check with reg = 0
Initial loss: 2.304896869438183
W1 relative error: 4.003267597777456e-07

```

1 Training a larger model

In general, proceeding with vanilla stochastic gradient descent to optimize models may be fraught with problems and limitations, as discussed in class. Thus, we implement optimizers that improve on SGD.

$1.1 \quad SGD + momentum$

In the following section, implement SGD with momentum. Read the nndl/optim.py API, which is provided by CS231n, and be sure you understand it. After, implement sgd_momentum in nndl/optim.py. Test your implementation of sgd_momentum by running the cell below.

```
[4]: from nndl.optim import sgd_momentum

N, D = 4, 5

w = np.linspace(-0.4, 0.6, num=N*D).reshape(N, D)
dw = np.linspace(-0.6, 0.4, num=N*D).reshape(N, D)
v = np.linspace(0.6, 0.9, num=N*D).reshape(N, D)
```

```
config = {'learning_rate': 1e-3, 'velocity': v}
next_w, _ = sgd_momentum(w, dw, config=config)
expected_next_w = np.asarray([
    [ 0.1406,
             0.20738947, 0.27417895, 0.34096842, 0.40775789],
    [0.47454737, 0.54133684, 0.60812632, 0.67491579, 0.74170526],
   [ 0.80849474, 0.87528421, 0.94207368, 1.00886316, 1.07565263],
   [1.14244211, 1.20923158, 1.27602105, 1.34281053, 1.4096
                                                               11)
expected_velocity = np.asarray([
             0.55475789, 0.56891579, 0.58307368, 0.59723158],
   0.5406.
   [ 0.61138947, 0.62554737, 0.63970526, 0.65386316, 0.66802105],
   [ 0.68217895, 0.69633684, 0.71049474, 0.72465263, 0.73881053],
    [ 0.75296842, 0.76712632, 0.78128421, 0.79544211, 0.8096
                                                               ]])
print('next w error: {}'.format(rel_error(next_w, expected_next_w)))
print('velocity error: {}'.format(rel_error(expected_velocity,__
```

next_w error: 8.882347033505819e-09 velocity error: 4.269287743278663e-09

1.2 SGD + Nesterov momentum

Implement sgd_nesterov_momentum in ndl/optim.py.

```
[5]: from nndl.optim import sgd_nesterov_momentum
    N, D = 4, 5
    w = np.linspace(-0.4, 0.6, num=N*D).reshape(N, D)
    dw = np.linspace(-0.6, 0.4, num=N*D).reshape(N, D)
    v = np.linspace(0.6, 0.9, num=N*D).reshape(N, D)
    config = {'learning_rate': 1e-3, 'velocity': v}
    next_w, _ = sgd_nesterov_momentum(w, dw, config=config)
    expected next w = np.asarray([
        [0.08714, 0.15246105, 0.21778211, 0.28310316, 0.34842421],
        [0.41374526, 0.47906632, 0.54438737, 0.60970842, 0.67502947],
        [0.74035053, 0.80567158, 0.87099263, 0.93631368, 1.00163474],
        [1.06695579, 1.13227684, 1.19759789, 1.26291895, 1.32824 ]])
    expected_velocity = np.asarray([
        [0.5406, 0.55475789, 0.56891579, 0.58307368, 0.59723158],
        [0.61138947, 0.62554737, 0.63970526, 0.65386316, 0.66802105],
        [ 0.68217895, 0.69633684, 0.71049474, 0.72465263, 0.73881053],
        [ 0.75296842, 0.76712632, 0.78128421, 0.79544211, 0.8096
                                                                      11)
    print('next_w error: {}'.format(rel_error(next_w, expected_next_w)))
```

next_w error: 1.0875186845081027e-08 velocity error: 4.269287743278663e-09

1.3 Evaluating SGD, SGD+Momentum, and SGD+NesterovMomentum

Run the following cell to train a 6 layer FC net with SGD, SGD+momentum, and SGD+Nesterov momentum. You should see that SGD+momentum achieves a better loss than SGD, and that SGD+Nesterov momentum achieves a slightly better loss (and training accuracy) than SGD+momentum.

```
[6]: num_train = 4000
     small_data = {
         'X_train': data['X_train'][:num_train],
         'y_train': data['y_train'][:num_train],
         'X_val': data['X_val'],
         'y_val': data['y_val'],
     }
     solvers = {}
     for update_rule in ['sgd', 'sgd_momentum', 'sgd_nesterov_momentum']:
         print('Optimizing with {}'.format(update_rule))
         model = FullyConnectedNet([100, 100, 100, 100, 100], weight_scale=5e-2)
         solver = Solver(model, small_data,
                         num_epochs=5, batch_size=100,
                         update_rule=update_rule,
                         optim_config={
                            'learning_rate': 1e-2,
                         },
                         verbose=False)
         solvers[update rule] = solver
         solver.train()
         print
     fig, axes = plt.subplots(3, 1)
     ax = axes[0]
     ax.set_title('Training loss')
     ax.set_xlabel('Iteration')
     ax = axes[1]
     ax.set_title('Training accuracy')
     ax.set_xlabel('Epoch')
```

```
ax = axes[2]
ax.set_title('Validation accuracy')
ax.set_xlabel('Epoch')

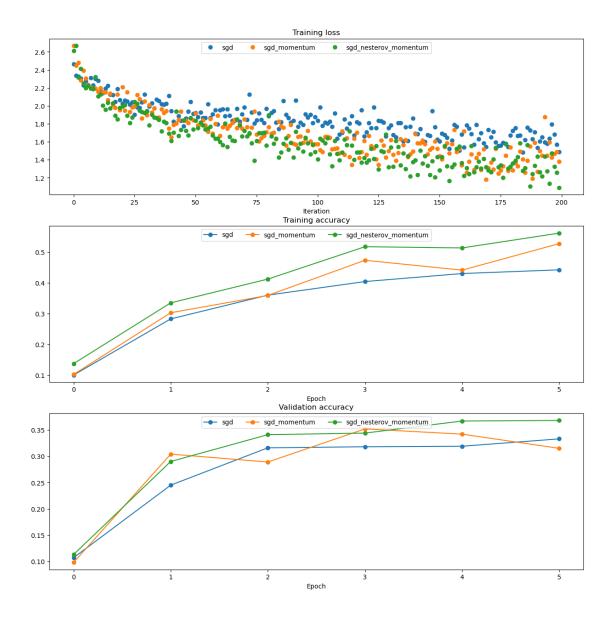

for update_rule, solver in solvers.items():
    ax = axes[0]
    ax.plot(solver.loss_history, 'o', label=update_rule)

    ax = axes[1]
    ax.plot(solver.train_acc_history, '-o', label=update_rule)

    ax = axes[2]
    ax.plot(solver.val_acc_history, '-o', label=update_rule)

for i in [1, 2, 3]:
    ax = axes[i - 1]
    ax.legend(loc='upper center', ncol=4)
plt.gcf().set_size_inches(15, 15)
plt.show()
```

Optimizing with sgd_momentum
Optimizing with sgd_nesterov_momentum

1.4 RMSProp

Now we go to techniques that adapt the gradient. Implement rmsprop in nndl/optim.py. Test your implementation by running the cell below.

```
[7]: from nndl.optim import rmsprop

N, D = 4, 5
w = np.linspace(-0.4, 0.6, num=N*D).reshape(N, D)
dw = np.linspace(-0.6, 0.4, num=N*D).reshape(N, D)
a = np.linspace(0.6, 0.9, num=N*D).reshape(N, D)

config = {'learning_rate': 1e-2, 'a': a}
```

next_w error: 9.524687511038133e-08 cache error: 2.6477955807156126e-09

1.5 Adaptive moments

Now, implement adam in nndl/optim.py. Test your implementation by running the cell below.

```
[8]: # Test Adam implementation; you should see errors around 1e-7 or less
    from nndl.optim import adam
    N, D = 4, 5
    w = np.linspace(-0.4, 0.6, num=N*D).reshape(N, D)
    dw = np.linspace(-0.6, 0.4, num=N*D).reshape(N, D)
    v = np.linspace(0.6, 0.9, num=N*D).reshape(N, D)
    a = np.linspace(0.7, 0.5, num=N*D).reshape(N, D)
    config = {'learning_rate': 1e-2, 'v': v, 'a': a, 't': 5}
    next_w, _ = adam(w, dw, config=config)
    expected_next_w = np.asarray([
      [-0.40094747, -0.34836187, -0.29577703, -0.24319299, -0.19060977],
      [-0.1380274, -0.08544591, -0.03286534, 0.01971428, 0.0722929],
      [0.1248705, 0.17744702, 0.23002243, 0.28259667, 0.33516969],
      [ 0.38774145, 0.44031188, 0.49288093, 0.54544852, 0.59801459]])
    expected_a = np.asarray([
      [0.69966, 0.68908382, 0.67851319, 0.66794809, 0.65738853,],
      [ 0.64683452, 0.63628604, 0.6257431, 0.61520571, 0.60467385,],
      [0.59414753, 0.58362676, 0.57311152, 0.56260183, 0.55209767,],
      [ 0.54159906, 0.53110598, 0.52061845, 0.51013645, 0.49966, ]])
    expected_v = np.asarray([
      [0.48, 0.49947368, 0.51894737, 0.53842105, 0.55789474],
      [ 0.57736842, 0.59684211, 0.61631579, 0.63578947, 0.65526316],
```

```
[ 0.67473684, 0.69421053, 0.71368421, 0.73315789, 0.75263158],
[ 0.77210526, 0.79157895, 0.81105263, 0.83052632, 0.85 ]])
print('next_w error: {}'.format(rel_error(expected_next_w, next_w)))
print('a error: {}'.format(rel_error(expected_a, config['a'])))
print('v error: {}'.format(rel_error(expected_v, config['v'])))
```

next_w error: 1.1395691798535431e-07
a error: 4.208314038113071e-09
v error: 4.214963193114416e-09

1.6 Comparing SGD, SGD+NesterovMomentum, RMSProp, and Adam

The following code will compare optimization with SGD, Momentum, Nesterov Momentum, RM-SProp and Adam. In our code, we find that RMSProp, Adam, and SGD + Nesterov Momentum achieve approximately the same training error after a few training epochs.

```
[9]: learning_rates = {'rmsprop': 2e-4, 'adam': 1e-3}
     for update_rule in ['adam', 'rmsprop']:
         print('Optimizing with {}'.format(update_rule))
         model = FullyConnectedNet([100, 100, 100, 100, 100], weight scale=5e-2)
         solver = Solver(model, small_data,
                         num_epochs=5, batch_size=100,
                         update_rule=update_rule,
                         optim_config={
                            'learning_rate': learning_rates[update_rule]
                         },
                         verbose=False)
         solvers[update_rule] = solver
         solver.train()
         print
     fig, axes = plt.subplots(3, 1)
     ax = axes[0]
     ax.set_title('Training loss')
     ax.set xlabel('Iteration')
     ax = axes[1]
     ax.set_title('Training accuracy')
     ax.set_xlabel('Epoch')
     ax = axes[2]
     ax.set_title('Validation accuracy')
     ax.set_xlabel('Epoch')
```

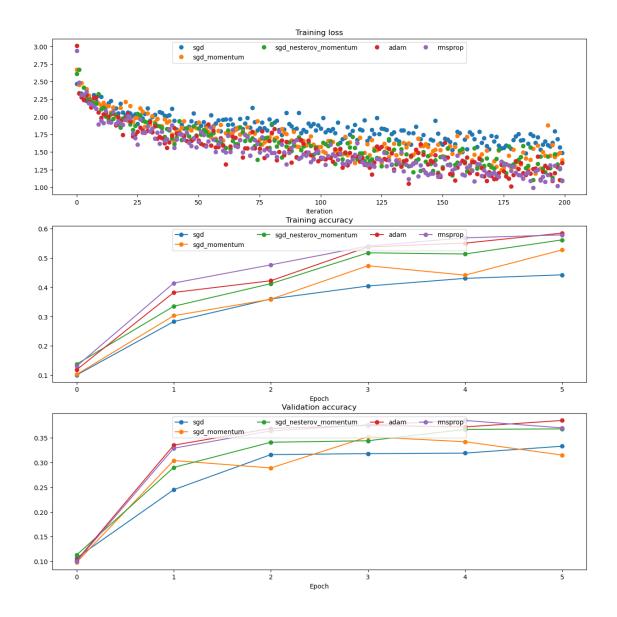

```
for update_rule, solver in solvers.items():
    ax = axes[0]
    ax.plot(solver.loss_history, 'o', label=update_rule)

    ax = axes[1]
    ax.plot(solver.train_acc_history, '-o', label=update_rule)

    ax = axes[2]
    ax.plot(solver.val_acc_history, '-o', label=update_rule)

for i in [1, 2, 3]:
    ax = axes[i - 1]
    ax.legend(loc='upper center', ncol=4)
plt.gcf().set_size_inches(15, 15)
plt.show()
```

Optimizing with adam Optimizing with rmsprop

1.7 Easier optimization

In the following cell, we'll train a 4 layer neural network having 500 units in each hidden layer with the different optimizers, and find that it is far easier to get up to 50+% performance on CIFAR-10. After we implement batchnorm and dropout, we'll ask you to get 55+% on CIFAR-10.

```
[11]: optimizer = 'adam'
best_model = None

layer_dims = [500, 500, 500]
weight_scale = 0.01
learning_rate = 1e-3
lr_decay = 0.9
```

```
model = FullyConnectedNet(layer_dims, weight_scale=weight_scale,
                           use_batchnorm=False)
solver = Solver(model, data,
                num_epochs=10, batch_size=100,
                update_rule=optimizer,
                optim_config={
                   'learning rate': learning rate,
                },
                lr decay=lr decay,
                verbose=True, print_every=50)
solver.train()
(Iteration 1 / 4900) loss: 2.283027
(Epoch 0 / 10) train acc: 0.109000; val_acc: 0.086000
(Iteration 51 / 4900) loss: 1.961103
(Iteration 101 / 4900) loss: 1.847143

Batch-Normalization

February 16, 2023

1 Batch Normalization

In this notebook, you will implement the batch normalization layers of a neural network to increase its performance. Please review the details of batch normalization from the lecture notes.

Utils has a solid API for building these modular frameworks and training them, and we will use this very well implemented framework as opposed to "reinventing the wheel." This includes using the Solver, various utility functions, and the layer structure. This also includes nndl.fc_net, nndl.layers, and nndl.layer_utils.

```
[1]: ## Import and setups
     import time
     import numpy as np
     import matplotlib.pyplot as plt
     from nndl.fc_net import *
     from nndl.layers import *
     from utils.data_utils import get_CIFAR10_data
     from utils.gradient_check import eval_numerical_gradient,_
      ⇔eval_numerical_gradient_array
     from utils.solver import Solver
     %matplotlib inline
     plt.rcParams['figure.figsize'] = (10.0, 8.0) # set default size of plots
     plt.rcParams['image.interpolation'] = 'nearest'
     plt.rcParams['image.cmap'] = 'gray'
     # for auto-reloading external modules
     # see http://stackoverflow.com/questions/1907993/
      \Rightarrow autoreload-of-modules-in-ipython
     %load ext autoreload
     %autoreload 2
     def rel_error(x, y):
         """ returns relative error """
         return np.max(np.abs(x - y) / (np.maximum(1e-8, np.abs(x) + np.abs(y))))
```

```
[2]: # Load the (preprocessed) CIFAR10 data.

data = get_CIFAR10_data()
for k in data.keys():
    print('{}: {} '.format(k, data[k].shape))

X_train: (49000, 3, 32, 32)
y_train: (49000,)
X_val: (1000, 3, 32, 32)
y_val: (1000,)
X_test: (1000, 3, 32, 32)
y_test: (1000,)
```

1.1 Batchnorm forward pass

Implement the training time batchnorm forward pass, batchnorm_forward, in nndl/layers.py. After that, test your implementation by running the following cell.

```
[3]: # Check the training-time forward pass by checking means and variances
     # of features both before and after batch normalization
     # Simulate the forward pass for a two-layer network
     N, D1, D2, D3 = 200, 50, 60, 3
     X = np.random.randn(N, D1)
     W1 = np.random.randn(D1, D2)
     W2 = np.random.randn(D2, D3)
     a = np.maximum(0, X.dot(W1)).dot(W2)
     print('Before batch normalization:')
     print(' means: ', a.mean(axis=0))
     print(' stds: ', a.std(axis=0))
     # Means should be close to zero and stds close to one
     print('After batch normalization (gamma=1, beta=0)')
     a norm, = batchnorm forward(a, np.ones(D3), np.zeros(D3), {'mode': 'train'})
     print(' mean: ', a_norm.mean(axis=0))
     print(' std: ', a_norm.std(axis=0))
     # Now means should be close to beta and stds close to gamma
     gamma = np.asarray([1.0, 2.0, 3.0])
     beta = np.asarray([11.0, 12.0, 13.0])
     a_norm, _ = batchnorm_forward(a, gamma, beta, {'mode': 'train'})
     print('After batch normalization (nontrivial gamma, beta)')
     print(' means: ', a_norm.mean(axis=0))
     print(' stds: ', a_norm.std(axis=0))
```

Before batch normalization:

```
means: [-10.00457198 16.04505515 19.23080314] stds: [37.41826382 31.96563484 36.48977956]
```

```
After batch normalization (gamma=1, beta=0)
mean: [-1.60982339e-17 3.61100039e-16 4.03010958e-16]
std: [1. 1. 1.]

After batch normalization (nontrivial gamma, beta)
means: [11. 12. 13.]
stds: [1. 1.99999999 2.99999999]
```

Implement the testing time batchnorm forward pass, batchnorm_forward, in nndl/layers.py. After that, test your implementation by running the following cell.

```
[4]: # Check the test-time forward pass by running the training-time
     # forward pass many times to warm up the running averages, and then
     # checking the means and variances of activations after a test-time
     # forward pass.
     N, D1, D2, D3 = 200, 50, 60, 3
     W1 = np.random.randn(D1, D2)
     W2 = np.random.randn(D2, D3)
     bn_param = {'mode': 'train'}
     gamma = np.ones(D3)
     beta = np.zeros(D3)
     for t in np.arange(50):
         X = np.random.randn(N, D1)
         a = np.maximum(0, X.dot(W1)).dot(W2)
         batchnorm_forward(a, gamma, beta, bn_param)
     bn param['mode'] = 'test'
     X = np.random.randn(N, D1)
     a = np.maximum(0, X.dot(W1)).dot(W2)
     a_norm, _ = batchnorm_forward(a, gamma, beta, bn_param)
     # Means should be close to zero and stds close to one, but will be
     # noisier than training-time forward passes.
     print('After batch normalization (test-time):')
     print(' means: ', a_norm.mean(axis=0))
     print(' stds: ', a_norm.std(axis=0))
```

After batch normalization (test-time): means: [-0.07583125 -0.08963107 -0.09446156]

stds: [0.94402115 0.96717243 1.05437211]

1.2 Batchnorm backward pass

Implement the backward pass for the batchnorm layer, batchnorm_backward in nndl/layers.py. Check your implementation by running the following cell.

```
[5]: # Gradient check batchnorm backward pass

N, D = 4, 5
```

```
x = 5 * np.random.randn(N, D) + 12
gamma = np.random.randn(D)
beta = np.random.randn(D)
dout = np.random.randn(N, D)
bn_param = {'mode': 'train'}
fx = lambda x: batchnorm_forward(x, gamma, beta, bn_param)[0]
fg = lambda gamma: batchnorm_forward(x, gamma, beta, bn_param)[0]
fb = lambda beta: batchnorm_forward(x, gamma, beta, bn_param)[0]
dx_num = eval_numerical_gradient_array(fx, x, dout)
da_num = eval_numerical_gradient_array(fg, gamma, dout)
db_num = eval_numerical_gradient_array(fb, beta, dout)
_, cache = batchnorm_forward(x, gamma, beta, bn_param)
dx, dgamma, dbeta = batchnorm_backward(dout, cache)
print('dx error: ', rel_error(dx_num, dx))
print('dgamma error: ', rel_error(da_num, dgamma))
print('dbeta error: ', rel_error(db_num, dbeta))
```

dx error: 1.0286924753847968e-08 dgamma error: 1.051318155351602e-11 dbeta error: 3.282273415383073e-12

1.3 Implement a fully connected neural network with batchnorm layers

Modify the FullyConnectedNet() class in nndl/fc_net.py to incorporate batchnorm layers. You will need to modify the class in the following areas:

- (1) The gammas and betas need to be initialized to 1's and 0's respectively in __init__.
- (2) The batchnorm_forward layer needs to be inserted between each affine and relu layer (except in the output layer) in a forward pass computation in loss. You may find it helpful to write an affine_batchnorm_relu() layer in nndl/layer_utils.py although this is not necessary.
- (3) The batchnorm_backward layer has to be appropriately inserted when calculating gradients.

After you have done the appropriate modifications, check your implementation by running the following cell.

Note, while the relative error for W3 should be small, as we backprop gradients more, you may find the relative error increases. Our relative error for W1 is on the order of 1e-4.

```
[6]: N, D, H1, H2, C = 2, 15, 20, 30, 10
X = np.random.randn(N, D)
y = np.random.randint(C, size=(N,))

for reg in [0, 3.14]:
    print('Running check with reg = ', reg)
    model = FullyConnectedNet([H1, H2], input_dim=D, num_classes=C,
```

```
reg=reg, weight_scale=5e-2, dtype=np.float64,
                               use_batchnorm=True)
    loss, grads = model.loss(X, y)
    print('Initial loss: ', loss)
    for name in sorted(grads):
        f = lambda _: model.loss(X, y)[0]
        grad_num = eval_numerical_gradient(f, model.params[name],_
  overbose=False, h=1e-5)
        print('{} relative error: {}'.format(name, rel_error(grad_num,_
  ⇒grads[name])))
    if reg == 0: print('\n')
Running check with reg = 0
Initial loss: 2.557708804606235
W1 relative error: 2.439478963329463e-05
W2 relative error: 3.36117016126612e-06

gamma2 relative error: 7.777982374209474e-09
```

1.4 Training a deep fully connected network with batch normalization.

To see if batchnorm helps, let's train a deep neural network with and without batch normalization.

```
[7]: # Try training a very deep net with batchnorm hidden_dims = [100, 100, 100, 100]
```

```
num_train = 1000
small_data = {
    'X_train': data['X_train'][:num_train],
    'y_train': data['y_train'][:num_train],
    'X_val': data['X_val'],
    'y_val': data['y_val'],
}
weight scale = 2e-2
bn_model = FullyConnectedNet(hidden_dims, weight_scale=weight_scale,_

use batchnorm=True)

model = FullyConnectedNet(hidden_dims, weight_scale=weight_scale,_

use_batchnorm=False)

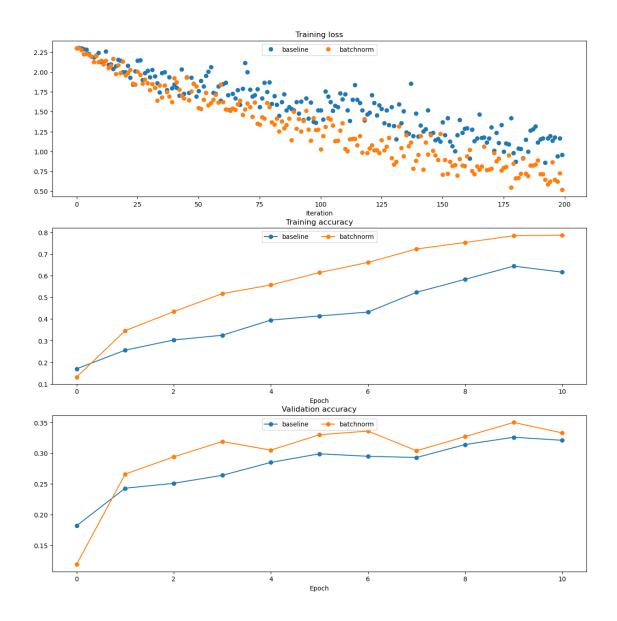

bn_solver = Solver(bn_model, small_data,
                num_epochs=10, batch_size=50,
                update_rule='adam',
                optim_config={
                  'learning_rate': 1e-3,
                },
                verbose=True, print_every=200)
bn_solver.train()
solver = Solver(model, small_data,
                num_epochs=10, batch_size=50,
                update_rule='adam',
                optim config={
                   'learning_rate': 1e-3,
                verbose=True, print_every=200)
solver.train()

1.6 Question:

In the cell below, summarize the findings of this experiment, and WHY these results make sense.

1.7 Answer:

Using a batchnorm in a neural network makes our network more robust to changes in weight initialization. If we do not use batchnorm, layer's activation output can become zero as we proceed to deeper layers (last layer is the deepest layer) depending on the initialization. Therefore, when we do not use batchnorm, neural networks are sensitive to weight initialization.

Dropout

February 16, 2023

1 Dropout

In this notebook, you will implement dropout. Then we will ask you to train a network with batchnorm and dropout, and acheive over 55% accuracy on CIFAR-10.

Utils has a solid API for building these modular frameworks and training them, and we will use this very well implemented framework as opposed to "reinventing the wheel." This includes using the Solver, various utility functions, and the layer structure. This also includes nndl.fc_net, nndl.layers, and nndl.layer_utils.

```
[1]: ## Import and setups
     import time
     import numpy as np
     import matplotlib.pyplot as plt
     from nndl.fc_net import *
     from nndl.layers import *
     from utils.data_utils import get_CIFAR10_data
     from utils.gradient_check import eval_numerical_gradient,_
      ⇔eval_numerical_gradient_array
     from utils.solver import Solver
     %matplotlib inline
     plt.rcParams['figure.figsize'] = (10.0, 8.0) # set default size of plots
     plt.rcParams['image.interpolation'] = 'nearest'
     plt.rcParams['image.cmap'] = 'gray'
     # for auto-reloading external modules
     # see http://stackoverflow.com/questions/1907993/
      \Rightarrow autoreload-of-modules-in-ipython
     %load ext autoreload
     %autoreload 2
     def rel_error(x, y):
         """ returns relative error """
         return np.max(np.abs(x - y) / (np.maximum(1e-8, np.abs(x) + np.abs(y))))
```

```
[2]: # Load the (preprocessed) CIFAR10 data.

data = get_CIFAR10_data()
for k in data.keys():
    print('{}: {} '.format(k, data[k].shape))

X_train: (49000, 3, 32, 32)
y_train: (49000,)
X_val: (1000, 3, 32, 32)
y_val: (1000,)
X_test: (1000, 3, 32, 32)
y_test: (1000,)
```

1.1 Dropout forward pass

Implement the training and test time dropout forward pass, dropout_forward, in nndl/layers.py. After that, test your implementation by running the following cell.

```
for p in [0.3, 0.6, 0.75]:
    out, _ = dropout_forward(x, {'mode': 'train', 'p': p})
    out_test, _ = dropout_forward(x, {'mode': 'test', 'p': p})

    print('Running tests with p = ', p)
    print('Mean of input: ', x.mean())
    print('Mean of train-time output: ', out.mean())
    print('Mean of test-time output: ', out_test.mean())
    print('Fraction of train-time output set to zero: ', (out == 0).mean())
    print('Fraction of test-time output set to zero: ', (out_test == 0).mean())
```

```
Running tests with p = 0.3
Mean of input: 10.002160636198084
Mean of train-time output: 10.034498191614126
Mean of test-time output: 10.002160636198084
Fraction of train-time output set to zero: 0.698856
Fraction of test-time output set to zero: 0.0
Running tests with p = 0.6
Mean of input: 10.002160636198084
Mean of train-time output: 10.014191558610936
Mean of test-time output: 10.002160636198084
Fraction of train-time output set to zero: 0.398984
Fraction of test-time output set to zero: 0.0
Running tests with p = 0.75
Mean of input: 10.002160636198084
Mean of train-time output: 9.991626951850632
Mean of test-time output: 10.002160636198084
Fraction of train-time output set to zero: 0.250844
Fraction of test-time output set to zero: 0.0
```

1.2 Dropout backward pass

Implement the backward pass, dropout_backward, in nndl/layers.py. After that, test your gradients by running the following cell:

dx relative error: 5.4456129818149784e-11

1.3 Implement a fully connected neural network with dropout layers

Modify the FullyConnectedNet() class in nndl/fc_net.py to incorporate dropout. A dropout layer should be incorporated after every ReLU layer. Concretely, there shouldn't be a dropout at the output layer since there is no ReLU at the output layer. You will need to modify the class in the following areas:

- (1) In the forward pass, you will need to incorporate a dropout layer after every relu layer.
- (2) In the backward pass, you will need to incorporate a dropout backward pass layer.

Check your implementation by running the following code. Our W1 gradient relative error is on the order of 1e-6 (the largest of all the relative errors).

```
print('{} relative error: {}'.format(name, rel_error(grad_num,_
  ⇒grads[name])))
    print('\n')
Running check with dropout = 0.5
Initial loss: 2.309771209610118

1.5 Question

Based off the results of this experiment, is dropout performing regularization? Explain your answer.

1.6 Answer:

Based off the results, it is clear to see that using dropout performs regularization for our neural network. It can be seen from the plot 1 that training accuracy reaches to 1 quicker than plot 2. Both validation accuracies are nearly end up to 0.33. Therefore, we get training accuracy close to 1, whereas we get validation accuracy close 0.33. This indicates that when we do not use dropout model overfits to the data. When we look at the results of dropout used neural network, we get training accuracy close to 0.75, whereas we get validation accuracy close to 0.33. Therefore, we do not overfit like we did in the first case. In result, we can conclude that dropout method can be used for regularization purposes.

Final part of the assignment Get over 55% validation accuracy on CIFAR-10 by using the layers you have implemented. You will be graded according to the following equation:

 $\min(\text{floor}((X - 32\%)) / 23\%, 1)$ where if you get 55% or higher validation accuracy, you get full points.

```

2
3
    This file implements various first-order update rules that are commonly used for
4
5
    training neural networks. Each update rule accepts current weights and the
6
    gradient of the loss with respect to those weights and produces the next set of
7
    weights. Each update rule has the same interface:
8
9
    def update(w, dw, config=None):
10
11
    Inputs:
12
      - w: A numpy array giving the current weights.
      - dw: A numpy array of the same shape as w giving the gradient of the
13
14
        loss with respect to w.
15
      - config: A dictionary containing hyperparameter values such as learning rate,
16
        momentum, etc. If the update rule requires caching values over many
        iterations, then config will also hold these cached values.
17
18
19
   Returns:
20
     - next w: The next point after the update.
21
      - config: The config dictionary to be passed to the next iteration of the
        update rule.
22
23
24
    NOTE: For most update rules, the default learning rate will probably not perform
25
    well; however the default values of the other hyperparameters should work well
26
    for a variety of different problems.
27
28
    For efficiency, update rules may perform in-place updates, mutating w and
29
    setting next w equal to w.
30
31
32
33
   def sgd(w, dw, config=None):
        11 11 11
34
35
        Performs vanilla stochastic gradient descent.
36

133
134
         During training the sample mean and (uncorrected) sample variance are
135
         computed from minibatch statistics and used to normalize the incoming data.
136
         During training we also keep an exponentially decaying running mean of the mean
137
         and variance of each feature, and these averages are used to normalize data
138
         at test-time.
139
140
         At each timestep we update the running averages for mean and variance using
141
         an exponential decay based on the momentum parameter:
142
143
         running mean = momentum * running mean + (1 - momentum) * sample mean
144
         running var = momentum * running var + (1 - momentum) * sample var
145
146
         Note that the batch normalization paper suggests a different test-time
147
         behavior: they compute sample mean and variance for each feature using a
148
         large number of training images rather than using a running average. For
         this implementation we have chosen to use running averages instead since
149
150
         they do not require an additional estimation step; the torch7 implementation
         of batch normalization also uses running averages.
151
152
153
         Input:
154
         - x: Data of shape (N, D)
         - gamma: Scale parameter of shape (D,)
155
156
         - beta: Shift paremeter of shape (D,)
157
         - bn param: Dictionary with the following keys:
158
           - mode: 'train' or 'test'; required
159
           - eps: Constant for numeric stability
160
          - momentum: Constant for running mean / variance.
161
          - running mean: Array of shape (D,) giving running mean of features
162
          - running_var Array of shape (D,) giving running variance of features
163
164
         Returns a tuple of:

    class TwoLayerNet(object):
9
10
        A two-layer fully-connected neural network with ReLU nonlinearity and
11
        softmax loss that uses a modular layer design. We assume an input dimension
12
        of D, a hidden dimension of H, and perform classification over C classes.
13
14
        The architecure should be affine - relu - affine - softmax.
15
16
        Note that this class does not implement gradient descent; instead, it
        will interact with a separate Solver object that is responsible for running
17
18
        optimization.
19
20
        The learnable parameters of the model are stored in the dictionary
21
        self.params that maps parameter names to numpy arrays.
22
23

60
61
           Compute loss and gradient for a minibatch of data.
62
           Inputs:
63
64
           - X: Array of input data of shape (N, d 1, ..., d k)
65
           - y: Array of labels, of shape (N,). y[i] gives the label for X[i].
67
           Returns:
```

```
68
           If y is None, then run a test-time forward pass of the model and return:
 69
           - scores: Array of shape (N, C) giving classification scores, where
 70
             scores[i, c] is the classification score for X[i] and class c.
 71
 72
           If y is not None, then run a training-time forward and backward pass and
73
           return a tuple of:
74
           - loss: Scalar value giving the loss
75
           - grads: Dictionary with the same keys as self.params, mapping parameter
 76
             names to gradients of the loss with respect to those parameters.
 77
 78
           scores = None
 79
 80
            # ----- #
81
            # YOUR CODE HERE:
 82
              Implement the forward pass of the two-layer neural network. Store
83
             the class scores as the variable 'scores'. Be sure to use the layers
 84
             you prior implemented.
            # ------ #
 85
           h, cache h = affine relu forward(X,self.params["W1"], self.params["b1"])
 86
 87

           # ================== #
124
125
126
           return loss, grads
127
128
129
   class FullyConnectedNet(object):
130
        A fully-connected neural network with an arbitrary number of hidden layers,
131
        ReLU nonlinearities, and a softmax loss function. This will also implement
132
```

dropout and batch normalization as options. For a network with L layers,

```
134
         the architecture will be
135
136
         {affine - [batch norm] - relu - [dropout]} x (L - 1) - affine - softmax
137
138
         where batch normalization and dropout are optional, and the {...} block is
139
         repeated L - 1 times.
140
         Similar to the TwoLayerNet above, learnable parameters are stored in the
141
          self.params dictionary and will be learned using the Solver class.
142
143
144
145
         def init (self, hidden dims, input dim=3*32*32, num classes=10,
146
                    dropout=1, use batchnorm=False, reg=0.0,
147
                    weight scale=1e-2, dtype=np.float32, seed=None):
148
149
             Initialize a new FullyConnectedNet.
150
151
             - hidden dims: A list of integers giving the size of each hidden layer.
152
153
             - input dim: An integer giving the size of the input.
154
             - num classes: An integer giving the number of classes to classify.
155
             - dropout: Scalar between 0 and 1 giving dropout strength. If dropout=1 then
156
               the network should not use dropout at all.
157
             - use batchnorm: Whether or not the network should use batch normalization.
158
             - reg: Scalar giving L2 regularization strength.
159
             - weight scale: Scalar giving the standard deviation for random
160
               initialization of the weights.
161
             - dtype: A numpy datatype object; all computations will be performed using
162
               this datatype. float32 is faster but less accurate, so you should use
163
               float64 for numeric gradient checking.
164
             - seed: If not None, then pass this random seed to the dropout layers. This
165
               will make the dropout layers deteriminstic so we can gradient check the
166
               model.
